**UNIT 2: Binomial Theorem for Positive Integral Indices**

*Specific Objectives:*

1. To recognize the notations  $n!$  and  $C_r^n$ .
2. To learn to expand a binomial with positive integral index by the binomial theorem.

Detailed Content	Time Ratio	Notes on Teaching
2.1 The $n!$ and $C_r^n$ notations	1	<p>The definitions of <math>n!</math> and <math>C_r^n</math> should be introduced. The idea of permutation and combination may only be mentioned to abler students. The definition of <math>0! = 1</math> should also be mentioned. It is desirable to bring students' attention to the other forms of <math>C_r^n</math>, viz, <math>{}_n C_r</math> and <math>\binom{n}{r}</math>.</p> <p>Students are expected to be able to verify <math>C_r^n = C_{n-r}^n</math> and <math>C_{r-1}^n + C_r^n = C_r^{n+1}</math>. In the latter part, teachers should guide students to start from L.H.S. and end up with R.H.S.</p> <p>Examples like the one below can be given.</p> <p><i>Example</i> Solve for n if <math>C_{n+1}^{18} = C_{2n+1}^{18}</math>.</p>
2.2 The Pascal Triangle	1	<p>Teachers can ask students to expand <math>(a + b)^2</math>, <math>(a + b)^3</math>, <math>(a + b)^4</math> and <math>(a + b)^5</math> by multiplication and fill the coefficients of the terms of the expanded expressions into the boxes below.</p> <div style="display: flex; align-items: flex-start;"> <div style="margin-right: 20px;"> <p><math>(a+b)^0</math></p> <p><math>(a+b)^1</math></p> <p><math>(a+b)^2</math></p> <p><math>(a+b)^3</math></p> <p><math>(a+b)^4</math></p> <p><math>(a+b)^5</math></p> </div>  </div>

Detailed Content	Time Ratio	Notes on Teaching
2.3 Expanding Binomials Using the Pascal Triangle	2	<p>Teachers should guide students to discover that the coefficients can be expressed as <math>C_r^n</math> and the properties of the elements of the Pascal triangle such as <math>C_r^n = C_{n-r}^n</math>, <math>C_0^n = 1</math>, <math>C_n^n = 1</math> and <math>C_{n-r}^n + C_r^n = C_r^{n+1}</math>.</p> <p>Students are expected to expand <math>(a + b)^n</math> with the aid of Pascal triangle up to and including <math>n=5</math>.</p> <p>The following examples are relevant.</p> <p><i>Example 1</i> Expand (a) <math>(2x+3)^4</math> in descending powers of <math>x</math>, (b) <math>(3x^2-1)^5</math> in ascending powers of <math>x</math>.</p> <p><i>Example 2</i> Find the term independent of <math>x</math> in the expansion of <math>(2x^3 - \frac{1}{3x^2})^5</math>.</p>
2.4 Binomial Theorem for Positive Integral Indices	<del>4</del> 7	<p>Starting with the Pascal triangle, teachers can introduce binomial theorem for positive integral indices. The proof of the theorem using mathematical induction is a good exercise for the students. Students should discover for themselves that in expanding <math>(x + y)^n</math>,</p> <p>(a) there are <math>(n+1)</math> terms and (b) the <math>(r + 1)^{\text{th}}</math> term is <math>C_r^n x^{n-r}y^r</math>, if the expansion is expressed in descending powers of <math>x</math>.</p> <p>The determination of the greatest term and relations between coefficients are not necessary. Examples such as the following can be given.</p>

Detailed Content	Time Ratio	Notes on Teaching
		<p><i>Example 1</i> Expand (a) <math>(2x + 3y)^4</math> (b) <math>(3x - \frac{2}{x})^5</math>.</p> <p><i>Example 2</i> Find the coefficient of <math>x^3</math> in the expansion of <math>(3 - \frac{1}{2}x)^6 \cdot (1+x)^5</math>.</p> <p><i>Example 3</i> In the expansion of <math>(1+ax)(1+bx)^6</math>, the coefficients of <math>x</math> and <math>x^2</math> are respectively 0 and <math>-\frac{21}{4}</math>, find the values of <math>a</math> and <math>b</math>.</p> <p>Although problems of multinomial expansion can be solved by repeated binomial expansions, teachers should avoid teaching multinomial expansion beyond the trinomials. The following can be useful exercises.</p> <p><i>Example 4</i> Expand <math>(1 - 2x + 3x^2)^3</math> in ascending powers of <math>x</math>.</p> <p><i>Example 5</i> Find the constant term in the expansion of <math>(1 + \frac{1}{2x} - 3x)^4</math>.</p> <p>For abler students, teachers may mention that the binomial theorem is also true for negative integral indices. Nevertheless, further development should be avoided.</p>
